Stock Module View layer progress	Sayfa No: 9

Today, I continued working on the **View layer** for the reporting screens in the **Stock module**. On the previous day, I had prepared the filter form. Today, I focused on the design and coding of the summary and detail tables.

First, I created the file Internal/Stock/Views/Report/_summary_table.php. In this table, I added columns for Opening, In, Out, and Closing values for each product. When the user selects filters and submits a query, the aggregated data from the Model can be displayed in this table. I kept the table simple and clear to allow managers to quickly understand the stock status.

Next, I prepared Internal/Stock/Views/Report/_detail_table.php, which lists stock movements on a row-by-row basis. The table columns include date, transaction type (IN/OUT), product name, quantity, reference number, and actor information. This allows users to see in detail which product was moved, in what quantity, and on which date.

Key points I focused on during coding:

- Making table headers clear and standardized,
- Designing the table structure for easy future integration with JavaScript plugins (e.g., DataTables),
- Enhancing readability by adjusting row spacing and alignment.

During testing, I confirmed that the data sent from the Controller was correctly displayed in the View files, and the tables worked as expected. With this, the basic interface of the reporting screens in the Stock module was completed.

```
<table id="tbl-summary" class="table table-striped table-sm align-middle mt-3">
    <thead>
    <tr>
        <th>Item</th><th>Measure</th><th>Category</th><th>Type</th>
        <th class="text-end">Opening</th>
        <th class="text-end">IN</th>
        <th class="text-end">OUT</th>
        <th class="text-end">Closing</th>
    </tr>
    </thead>
    <tbody></tbody>
</table>
```
