Clothes Module View Layer Completed	Sayfa No: 15

On the fifth day, I continued working on the View layer of the reporting screen for the Clothes module. On the previous day, I had prepared the filter form. Today, my goal was to create the summary and detail tables, making the reporting screen fully accessible to the user.

First, I prepared the Internal/Clothes/Views/Report/_summary_table.php file. This table lists the total quantities according to product name and size. When the user selects filters and submits the query, the data received from the Model is displayed in the table, showing the total quantity for each product–size combination. This structure allows administrators to easily see how many items of each size were distributed in a given period.

Next, I created the Internal/Clothes/Views/Report/_detail_table.php file. In this table, deliveries are listed row by row. The columns include delivery date, staff name, unit, gender, product name, size, and quantity. This allows users to examine each delivery in detail.

While coding, I paid particular attention to:

- Making table headers clear and understandable,
- Ensuring the table layout is readable and well-organized,
- Designing the HTML structure to be simple and flexible for future integration with Excel, PDF, or print functions.

During testing, I confirmed that the data sent from the Controller was correctly displayed in the tables. When filters were changed, both the summary and detail tables were reloaded with updated data.

By the end of the day, I completed the View layer of the reporting screen for the Clothes module. Users can now filter data and view both summary and detail tables on the same screen

```html
<table id="tbl-detail" class="table table-bordered table-sm align-middle">
    <thead>
    <tr>
        <th>Date</th>
        <th>Staff</th>
        <th>Unit</th>
        <th>Gender</th>
        <th>Item</th>
        <th>Size</th>
        <th class="text-end">Qty</th>
    </tr>
    </thead>
    <tbody></tbody>
</table>
```
